

## 5 CONCLUSIONS

In martial law, when access to traditional education may be limited, digital technologies provide the opportunity to continue learning and develop students' mathematical skills remotely.

A virtual mathematics website based on WordPress provides students with an effective tool for learning mathematics in an interactive and adaptive environment that ensures the implementation of effective student-centered learning. Modeling the educational process with the help of digital technologies allows students to get access to relevant educational content, interact with teachers and classmates, as well as perform dynamic tasks and tests online.

As we can see, the changing trends in the development of society require from students the ability to adapt to new conditions of the organization of the educational process, and from teachers - the desire to change, to get used to living and working in conditions of uncertainty [19]. In the era of informatization (digitalization) of society and education, in particular, "a modern teacher must possess innovative practices for implementing adaptive, mixed, distance, cloud, and mobile learning" [20]. This prompts teachers to pedagogical design and development of digital technologies for the transformation of traditional approaches to learning and increasing work productivity, revealing one's own individuality.
